

10 MARCH
2023

CLIMATE MONITORING AND PREDICTION FOR SRI LANKA

HIGHLIGHTS

Rainfall Prediction

- Fairly heavy rainfall (55 mm) is predicted for the Southern province, and less rainfall is expected for rest of the country during the 11th March – 15th March.

Monitored Rainfalls

- During the last week, average daily rainfall over Sri Lanka was 2.4 mm and hydro catchment areas received 3.6 mm.
- Highest average rainfall 3.6 mm/day was received to Eastern plains.

Monitored Wind

- From 28th Feb - 6th Mar, up to 8 m/s of north easterly winds were experienced at 850 mb level over the island.
- During 11th - 17th March easterly winds are expected for the country.

Monitored Sea & Land Temp

- Sea surface temperature around Sri Lanka was below normal for northern half of the island.
- Land surface temperature remained near normal.

Monitoring Rainfall

Ocean State *(Text Courtesy IRI)*

Pacific sea state: March 06, 2023

Equatorial sea surface temperatures (SSTs) are below average across most of the Pacific Ocean early - March. The tropical Pacific atmosphere is consistent with La Niña. A large majority of the models indicate ENSO-neutral conditions will begin within the next couple of months, and persist through the Northern Hemisphere spring and early summer.

Indian Ocean State

Sea surface temperature around Sri Lanka was below - 0.5°C to the northern half of the country in 1st February, 2023. Across the Indian Ocean, a classical negative Indian Ocean Dipole prevails as is typical during a La Niña.

Predictions

Rainfall

14-day prediction: NOAA NCEP models

From 9th March – 15th March:

Total rainfall by Provinces:

Rainfall	Provinces
55 mm	Southern
45 mm	Eastern, Sabaragamuwa
35 mm	Central, Uva, Western
25 mm	North Central, North Western
≤15 mm	Northern

From 16th March – 22nd March:

Total rainfall by Provinces:

Rainfall	Provinces
45 mm	Southern, Eastern, Sabaragamuwa
35 mm	Western, Central, North Central, Uva
25 mm	North Western
≤15 mm	Northern

MJO based OLR predictions

For the next 15 days:

MJO shall moderately suppress the rainfall during 9th March – 13th March, moderately enhance the rainfall during 14th March – 18th March, and significantly enhance the rainfall during 19th March – 23rd March for Sri Lanka.

Interpretation

Monitoring

Rainfall: During the last two weeks, there had been moderately rainfall over the following area:
Batticaloa

Daily Average Rainfall in the Met stations for previous week of (2nd March – 8th March) = 2.4 mm

R max: 38.4 mm & R min: 0.0 mm.

Region	Average rainfall for the Last 8 days
Northern Plains	0.7 mm
Eastern	3.6 mm
Western	3.1 mm
Southern Plains	1.8 mm

The Hydro Catchment Areas recorded 3.6 mm of average rainfall for the last week

R max: 32.0 mm & R min: 0.0 mm.

Wind: North easterly winds prevailed in the sea area and around the island last week.

Temperatures: The temperature anomalies were below normal for the Uva province and some parts of the Northern, Central, Eastern, North Central and Southern Provinces driven by the warm SST's.

Predictions

Rainfall: During the next week (11th March – 15th March), fairly heavy rainfall (55 mm) is predicted for the Southern province, and less rainfall is expected for rest of the country.

Temperatures: The temperature will remain above normal for some parts of the Sabaragamuwa, North Western, and Southern provinces and below normal for some parts of the Central province during 11th March – 19th March.

Teleconnections: ENSO-neutral conditions will begin within the next couple of months, and persist through the Northern Hemisphere spring and early summer.

MJO shall slightly suppress the rainfall during 9th March – 13th March, moderately enhance the rainfall during 14th March – 18th March, and significantly enhance the rainfall during 19th March – 23rd March for Sri Lanka.

Seasonal Precipitation: The precipitation forecast for the March-April-May in 2023 season shows a higher tendency of above-normal precipitation for southern half of the country.

Terminology for Rainfall Ranges

	Rainfall (During 24 hours of period)
Light Showers	Less than 12.5 mm
Light to Moderate	Between 12.5 mm and 25 mm
Moderate	Between 25 mm and 50 mm
Fairly Heavy	Between 50 mm and 100 mm
Heavy	Between 100 mm and 150 mm
Very Heavy	More than 150 mm

Weekly Climate Bulletin for Sri Lanka

Inside This Issue

1. Monitoring

- a. Daily Rainfall Monitoring
- b. Weekly Rainfall Monitoring
- c. Monthly Rainfall Monitoring
- d. Dekadal (10 Day) Satellite Derived Rainfall Estimates
- e. Weekly Temperature Monitoring
- f. Weekly Wind Monitoring
- g. Weekly Average SST Anomalies

2. Predictions

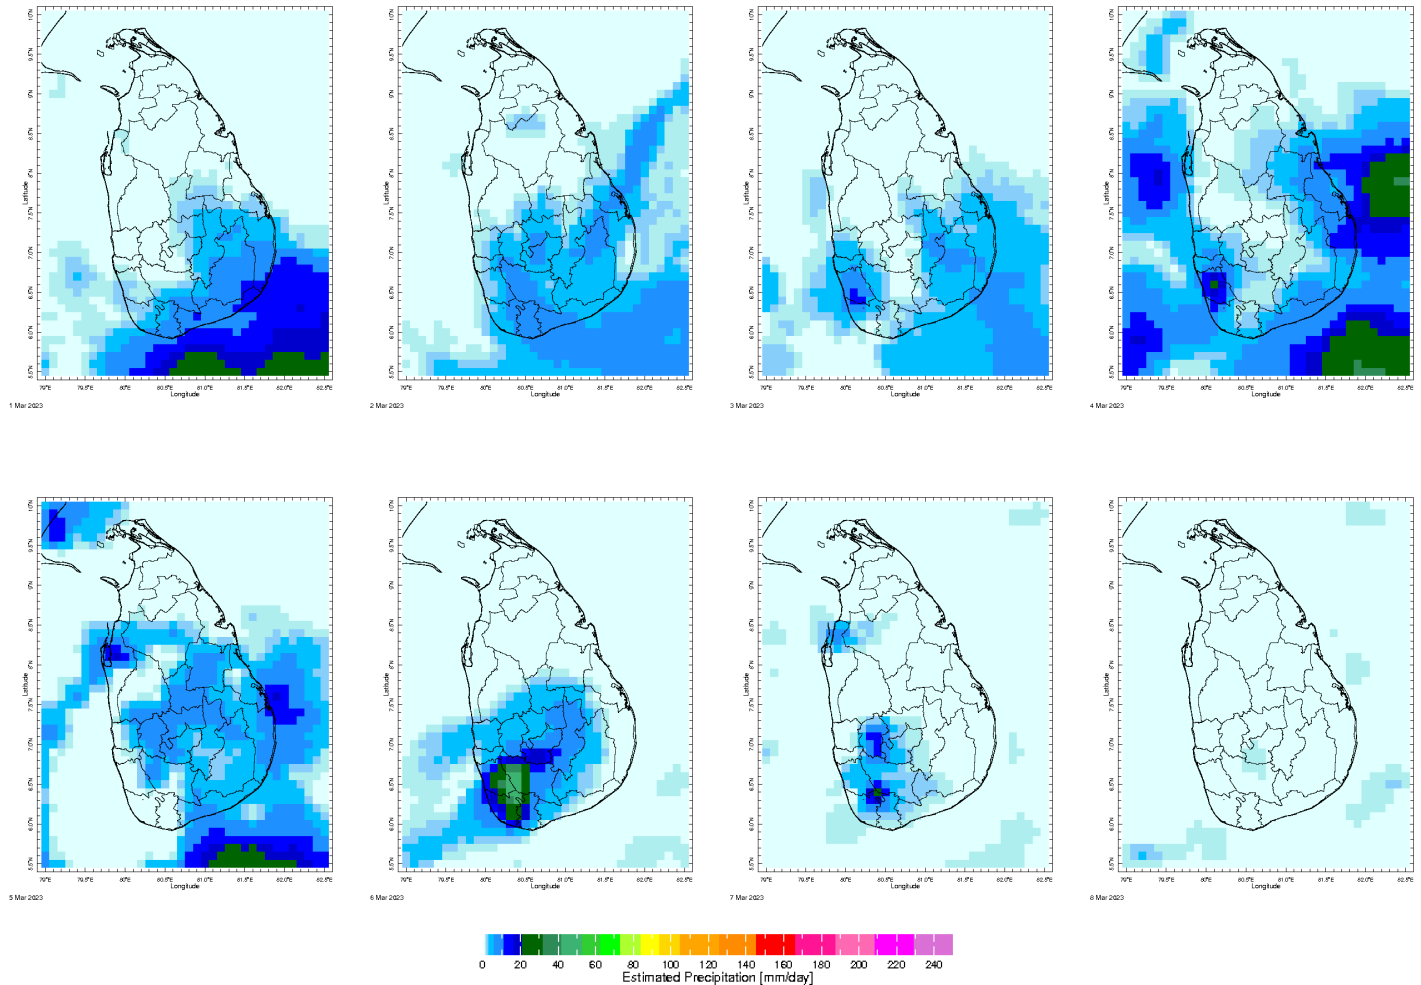

- a. NCEP GFS Ensemble 1-14 day Rainfall Predictions
- b. GFS (T574) Model Rainfall Forecast from RMSC New Delhi
- c. MJO Related OLR Forecast
- d. Weekly Temperature Forecast
- e. Weekly Wind Forecast
- f. Seasonal Predictions from IRI

MONITORING

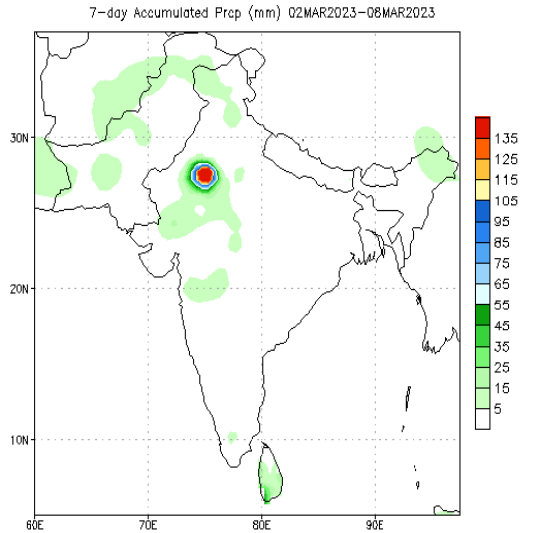

Daily Rainfall Monitoring

The following figures show the satellite observed rainfall in the last 7 days in Sri Lanka.

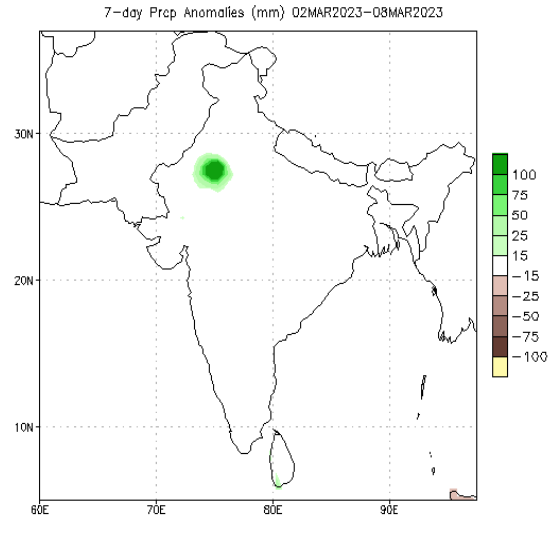

Weekly Rainfall Monitoring

The following figures show the total satellite observed rainfall in the last week in Sri Lanka. The figure in the left is the total 7-day rainfall from NOAA Climate Prediction Center (CPC) Unified Precipitation Analysis and the figure in the right is the total 7-day rainfall from CPC RFE 2.0 Satellite Rainfall Estimates. The bottom two figures are the respective anomalies.

Data Source: CPC Unified (gauge-based & 0.5x0.5 deg resolution) Precipitation Analysis

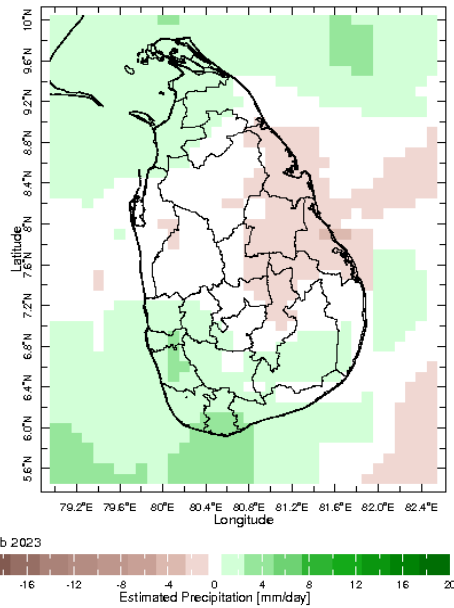

Data Source: CPC Unified (gauge-based & 0.5x0.5 deg resolution) Precipitation Analysis Climatology (1991-2020)

Monthly Rainfall Monitoring

The figure in the left shows the average observed rainfall in the previous month. The rainfall anomaly in the previous month is shown in the figure to the right. The brown color in the anomaly figure shows places which received less rainfall than the historical average while the green color shows places with above average rainfall. Darker shades show higher magnitudes in rainfall

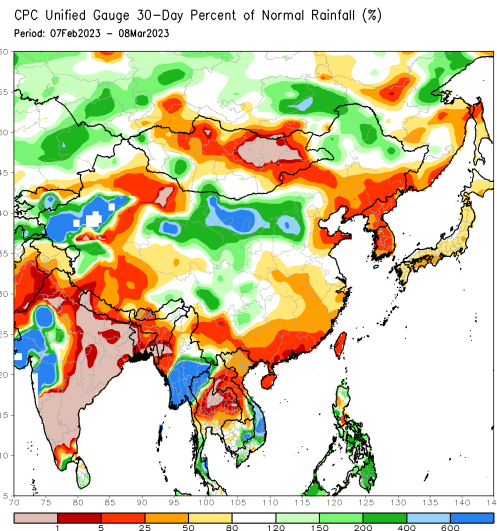

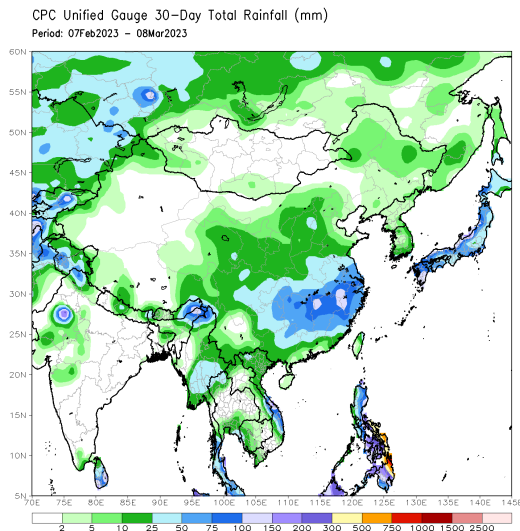

Monthly Average

Monthly Anomaly

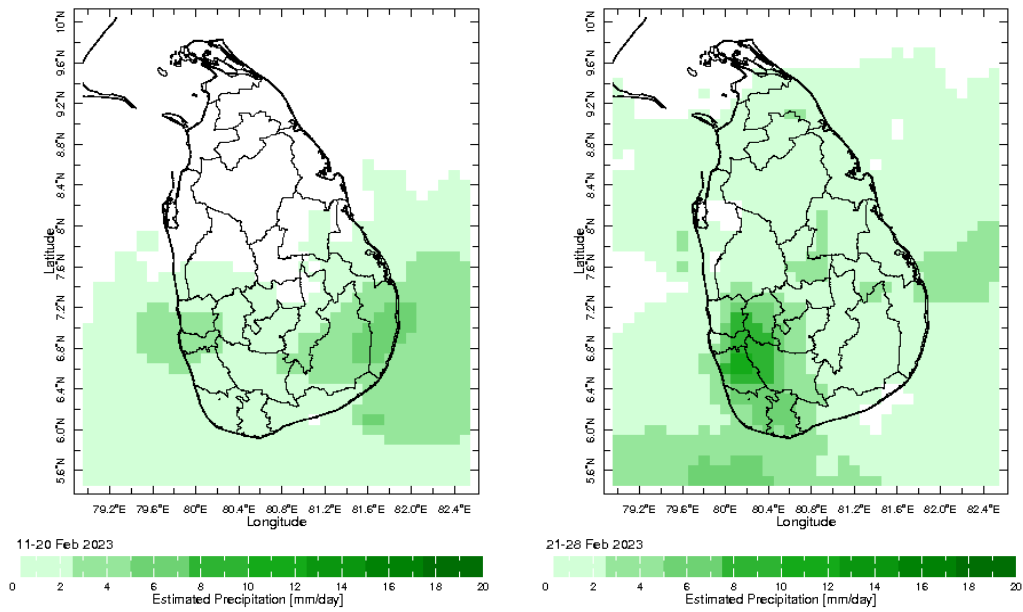

The figure in the top-left shows the total rainfall in the past 30 days from CPC Unified Precipitation Analysis while the figure in the top-right shows the total rainfall for the same period from RFE 2.0 Satellite Rainfall Estimates. The bottom two figures show the percentage of rainfall received in the past 30 days compared to normal rainfall in this period.

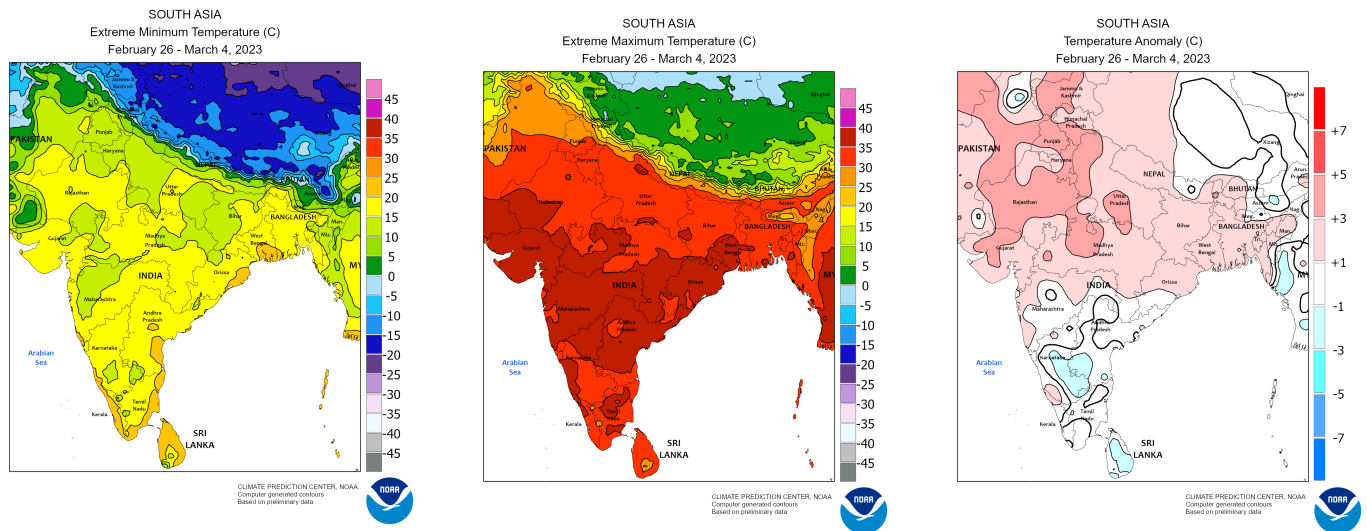

The following figure shows the observed accumulated rainfall (top) and daily observed rainfall (bottom) in Sri Lanka in the last 30 days.

Dekadal (10 Day) Satellite Derived Rainfall Estimates

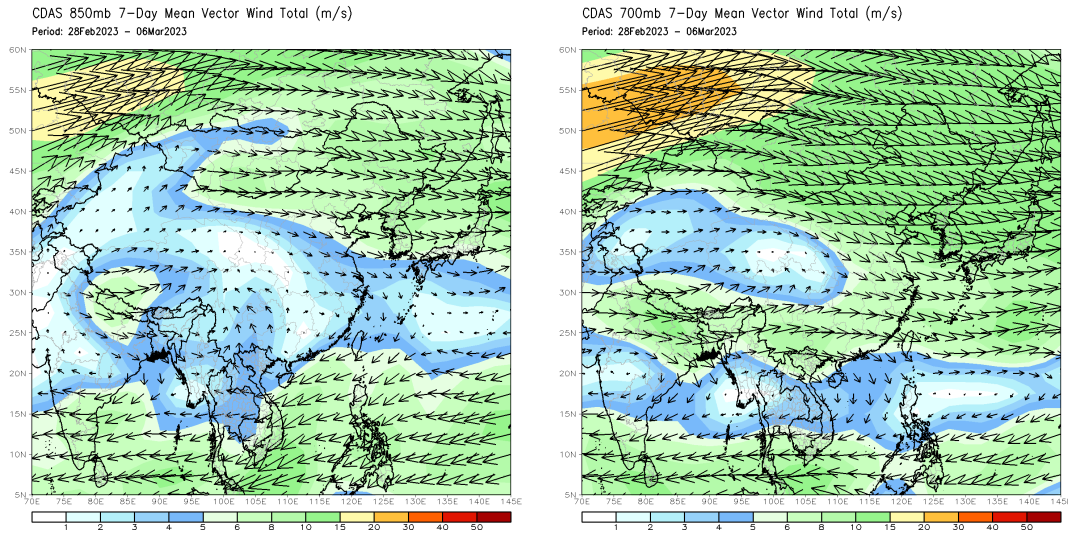

Weekly Temperature Monitoring

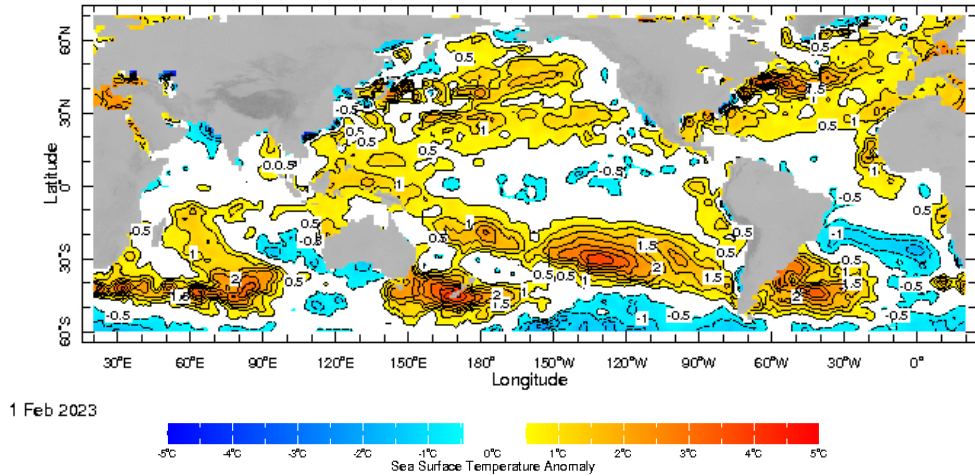

Weekly Wind Monitoring

The following figures show the mean vector wind total of the past 7 days near Sri Lanka at two levels. The figure on the left shows 850 mb (~1500 m) level and the figure on the right shows 700 mb (~3000 m) level.

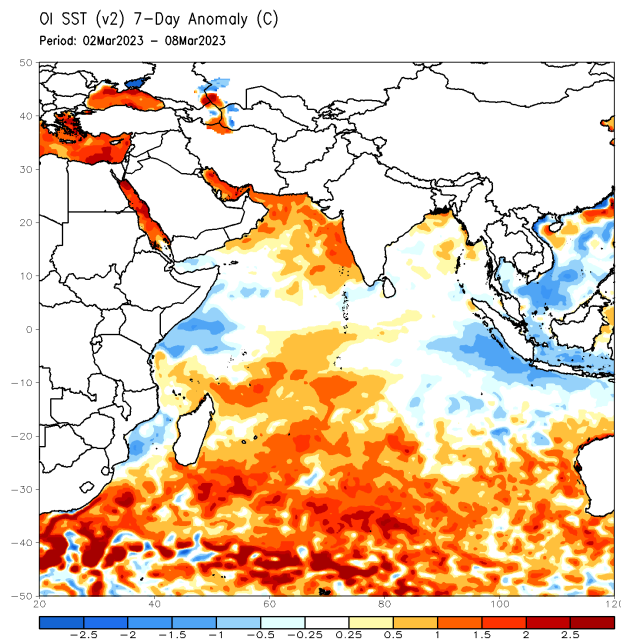

Weekly Average SST Anomalies

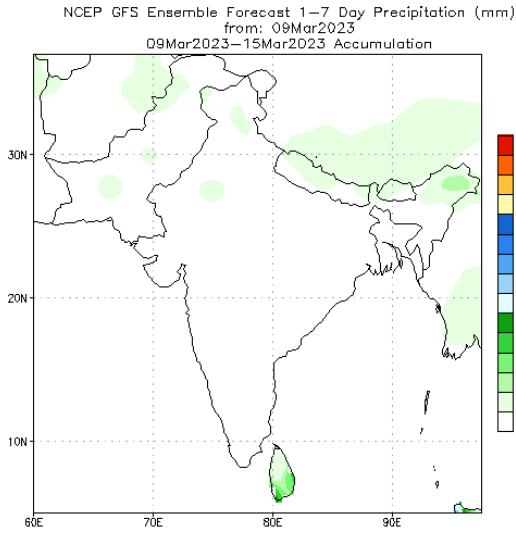

Weekly average Sea Surface Temperature (SST) anomaly in the world from NOAA NCEP

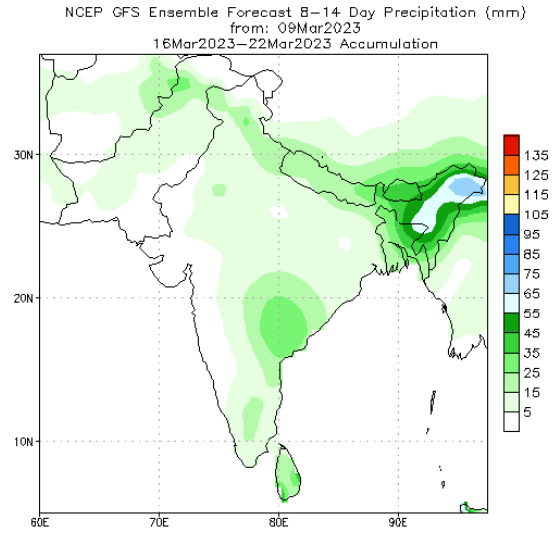

Optimum Interpolated Sea Surface Temperature Anomaly in the Indian Ocean from NOAA CPC

NCEP GFS 1- 14 Day prediction

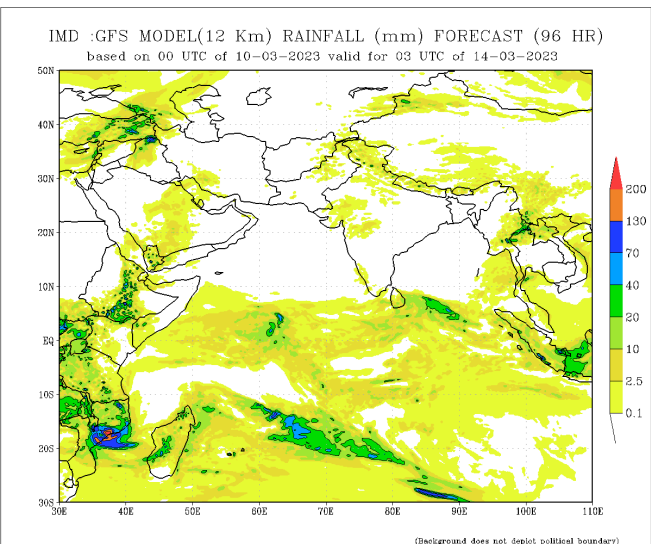

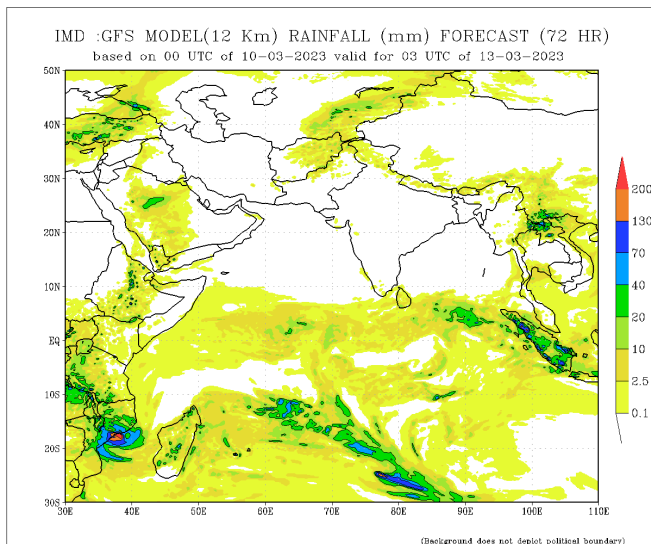

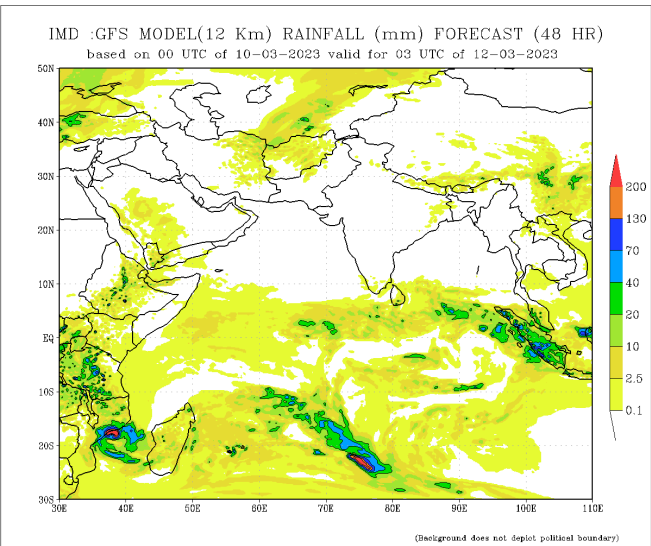

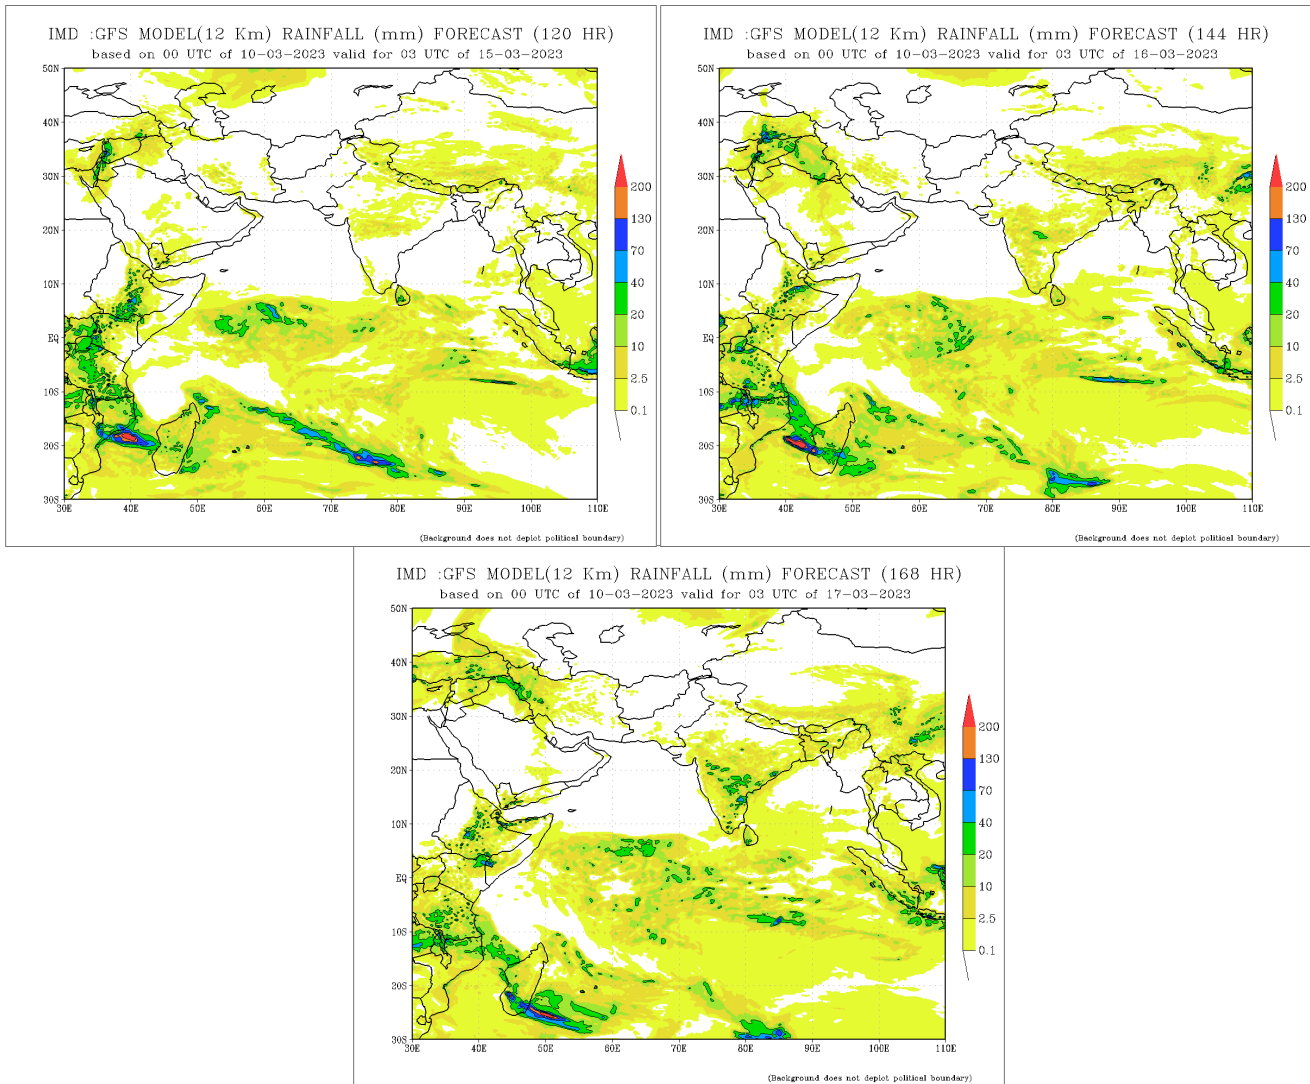

Bias correction based on last 30-day forecast error

Bias correction based on last 30-day forecast error

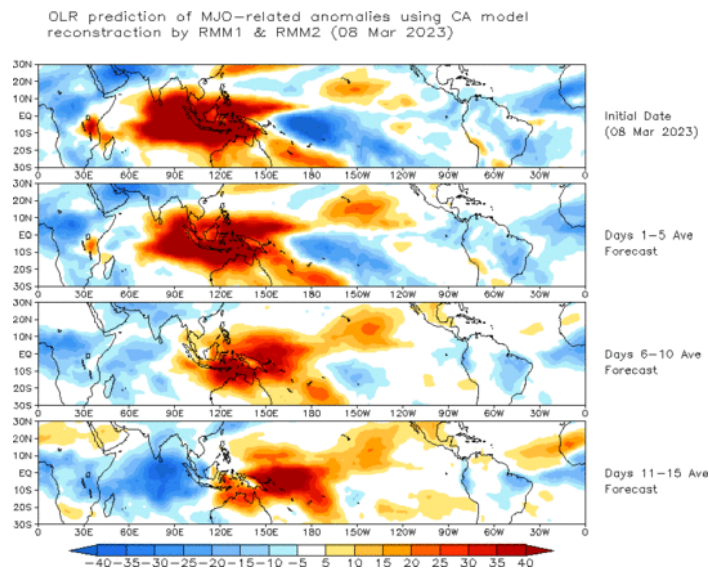

IMD GFS (T574) Model Rainfall Forecast from RMSC New Delhi, India

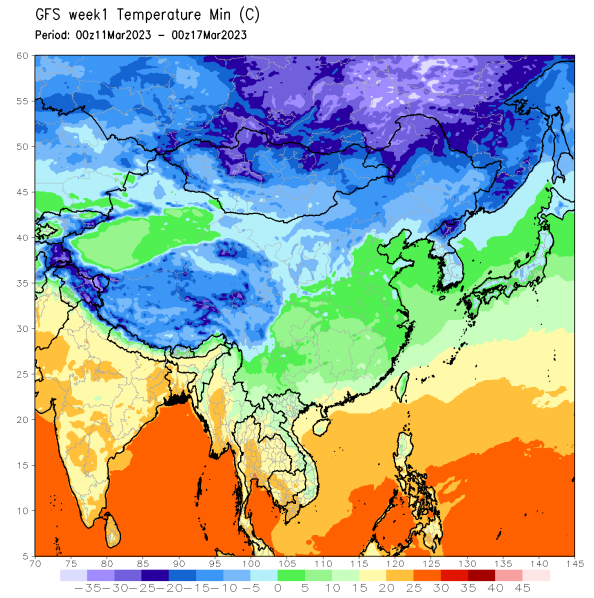

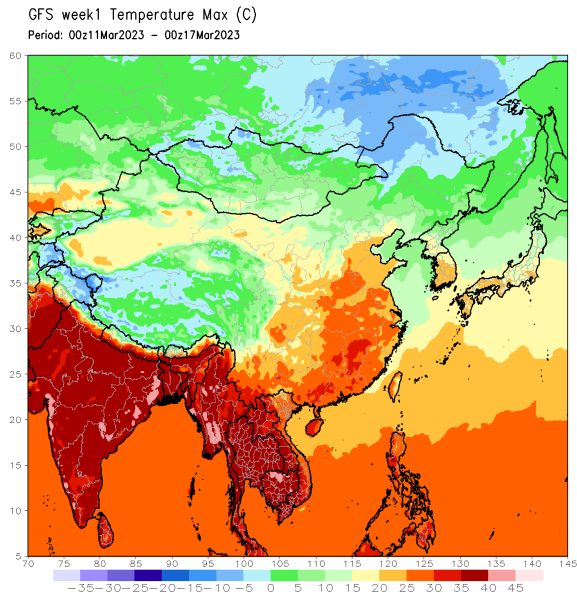

Madden Julian Oscillation (MJO) related Outgoing Longwave Radiation (OLR) Forecast

The Outgoing Longwave Radiation (OLR) is a proxy for rainfall. This can be used to identify convective rain clouds based on the MJO phase. Violet and Blue shading indicates enhanced tropical weather and Orange shading indicates suppressed conditions. The following figure shows the forecasts of MJO associated anomalous OLR for the next 15 days from the Constructed Analogue (CA) model forecasts.

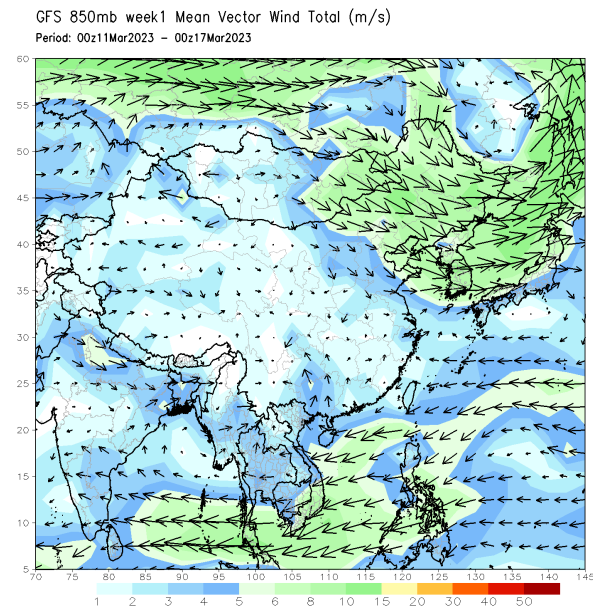

Weekly Temperature Forecast

Weekly Minimum and Maximum Temperature prediction from the GFS model (from NOAA CPC)

Weekly Wind Forecast

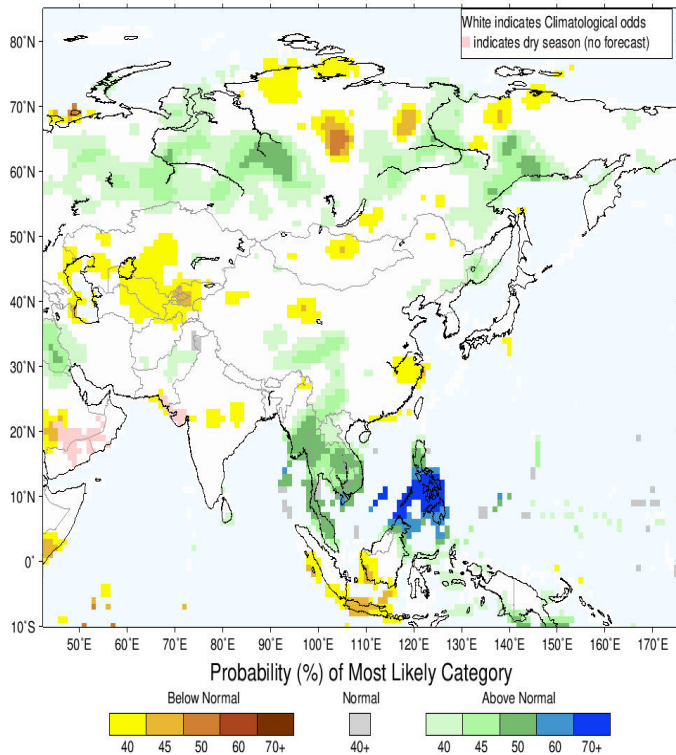

Weekly mean vector wind total prediction from the GFS model at 850 mb (left) and 700 mb (right) levels. (from NOAA CPC)

Seasonal Rainfall and Temperature Forecast

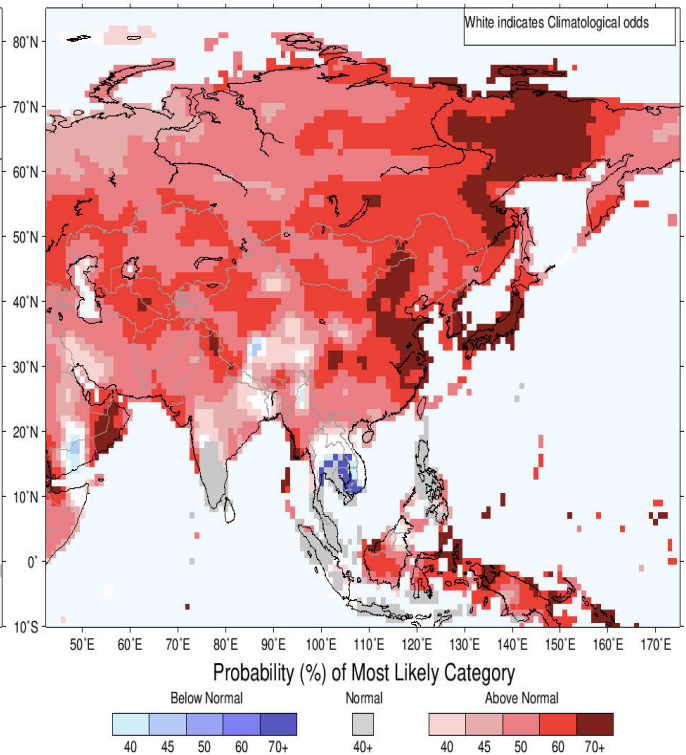

Following is the latest seasonal precipitation and temperature prediction for the next 3 months by the IRI. The color shading indicates the probability of the most dominant tercile – that is, the tercile having the highest forecast probability. The color bar alongside the map defines these dominant tercile probability levels. The upper side of the color bar shows the colors used for increasingly strong probabilities when the dominant tercile is the above-normal tercile, while the lower side shows likewise for the below-normal tercile. The gray color indicates an enhanced probability for the near-normal tercile (nearly always limited to 40%).
