# **5 June, 2014**PACIFIC SEAS STATE

During April through May the observed ENSO conditions moved from warm-neutral to the borderline of a weak El Niño condition. Most of the ENSO prediction models indicate a continued warming trend, with a transition to sustained El Niño conditions by the early northern summer.

(Text Courtesy IRI)

## INDIAN OCEAN STATE

Seas around Sri Lanka showed 0.5°C higher than average sea surface temperature.

#### **MJO STATE**

MJD is at phase 4

#### Highlights

#### **Monitoring and Predictions:**

The South Western region of the country, particularly Kalutara and Ratnapura districts shall continue to receive high rainfall during this week. Some models predict rainfall in the entire western half of the country during the next few days. The rest of the country shall not receive a significant amount of rainfall during the next couple of weeks. The Sea surface temperature around the country is warmer than usual. Sustained El Nino conditions are predicted by June-July of this year.

#### **Summary**

#### Monitoring

**Weekly Monitoring:** During  $10^{th} - 16^{th}$  June 2014 heavy rainfall was only observed on the  $11^{th}$  and  $12^{th}$  of June in South Western regions of Sri Lanka. Seas toward south west of the country also received rainfall during these two days. On the  $13^{th}$  light rainfall was observed in North central region of the country as well as in seas north east of the country. Highest rainfall during this week was observed on the  $12^{th}$  in Kalutara and Ratnapura districts.

**Monthly Monitoring:** The average rainfall received by the entire country was less than 8 mm/day. The highest observed rainfall was in the Northern parts of Ampara and Badulla districts. Except for these regions and the Anuradhapura district less than average rainfall was observed all over Sri Lanka. During the first ten days of June, very high rainfall averaging up to 20 mm/day was observed in south western regions of Sri Lanka.

#### Predictions

**14 day prediction:** During this week (18<sup>th</sup>- 24<sup>th</sup> June) south western regions of the country shall receive further rainfall up to 75 mm. There shall be a reduction in the rainfall during the next week (25<sup>th</sup> June- 1<sup>st</sup> July) and rainfall for the week is expected only in south western region.

*IMD WRF &IRI Model Forecast:* According to the IMD WRF model the western half of Sri Lanka shall continue to receive rainfall up to 65 mm during 20<sup>th</sup> of June and shall expand to entire southern Sri Lanka on the 21<sup>st</sup>. Highest rainfall is expected in Kalutara and Ratnapura districts. Rainfall prediction from the IRI for 18<sup>th</sup>-23<sup>rd</sup> June also specify a similar rainfall pattern.

30 Days Prediction: The decreasing rainfall trend is still evident in the entire country except in the eastern coast.

**Seasonal Prediction:** As per IRI Multi Model Probability Forecast issued on May 2014; for June 2014 to August 2014, there is a more than 70% probability for temperature to be above normal for Hambantota district and 60-70% probability for temperature to be above normal for rest of the regions in Sri Lanka in the country while the rainfall is to be climatological.

#### Inside this Issue

#### 1. Monitoring

- a. Daily Satellite Derived Rain fall Estimates
- b. Monthly Rain fall Estimates
- c. Decadal (10 Day) Satellite Derived Rainfall Estimates
- d. Weekly Average SST Anomalies

#### 2. Predictions

- a. NCEP GFS Ensemble 1-14 day predictions
- b. WRF model forecast Regional Meteorological Center, Chennai, Indian Meteorological Department)
- c. Weekly precipitation forecast (IRI)
- d. 1 month experimental predictions by Paul Roundy and L. Zubair
- e. Seasonal Predictions from IRI
