#### PACIFIC SEAS STATE

#### **December 20, 2012**

Most of the ENSO prediction models predict natural ENSO conditions through the first half of 2013. During early December the observed SST conditions have been in the neutral range.

# INDIAN OCEAN STATE

# January 4<sup>th</sup>-5<sup>th</sup>, 2013

During January 4<sup>th</sup>-5<sup>th</sup> 2013, SST shall be warmer over tropical Indian Ocean than the Bay of Bengal.

#### Highlights

#### **Monitoring and Predictions:**

Rainfall accumulation of more than 135 mm is expected for the 2<sup>nd</sup>-8<sup>th</sup>January for the entire country. 1/3<sup>rd</sup> of Southern Sri Lanka shall receive extremely heavy rainfall, and heavy showers shall be experienced in the remaining regions of Sri Lanka. The monthly predictions point to significantly high rainfall on the 22<sup>nd</sup> of January for the entire country, however considerable amount of rainfall shall persists during the month of January for entire Sri Lanka.

#### **Summary**

#### Monitoring

**Weekly Monitoring:** From 24<sup>th</sup> December 2012-1<sup>st</sup> January 2013, rainfall ranged between 5-145 mm with the highest amount of precipitation observed in the Galle district on the 25<sup>th</sup> of December. During 24<sup>th</sup>-27<sup>th</sup> more or less the entire country received heavy rainfall compared to the period of 25<sup>th</sup> December-1<sup>st</sup> January 2013.

#### **Predictions**

**7-day prediction:** During the period 2<sup>nd</sup>-8<sup>th</sup> January 2013, the entire country shall receive more than 135 mm rainfall.

*IMD WRF Model Forecast & IRI forecast:* For the 5<sup>th</sup> of January 2013, IMD WRF model predicts less than 36 mm of rainfall for Batticaloa and Polonnaruwa districts. Rainfall shall spread with a decreasing trend towards northern parts of Sri Lanka. For the same day less than 2.5 mm of rainfall is predicted for the Galle district. For the 6<sup>th</sup> of January 2013, less than 8 mm of rainfall is predicted for Batticaloa, Ampara and Badulla districts. NOAA models forecast extremely heavy rainfall for the southern part of the country and very heavy rainfall for the remaining regions.

**30 Days Prediction: Overall-** Ongoing heavy rainfall shall persist till 5<sup>th</sup> January 2013 and rainfall shall decrease during 5<sup>th</sup>-10<sup>th</sup>. Rainfall shall increase on the 22<sup>nd</sup> and an extreme amount of rainfall is expected for the entire country. **Western Slopes-** When compared to rest of the regions, western slopes shall receive higher amount of rainfall. During the month of January, the heaviest daily rainfall of 18 mm is expected on the 22<sup>nd</sup> of January. **Western Coast-** Rainfall shall remain constant for the period of 2<sup>nd</sup>-20<sup>th</sup> January and vary in the range between 5-9 mm. The heaviest rainfall of the month is expected on the 22<sup>nd</sup>. **Eastern slopes-** Significant heavy rainfall is not predicted for this region, but there shall be a significant increase in the rainfall on the 22<sup>nd</sup>. **Eastern Coast-** Compared with the eastern slopes more rainfall shall be observed for this season with a similar rainfall pattern. **Northern & Southern-** Significant heavy rainfall is not predicted for these regions, but there shall be a significant increase in the rainfall on the 22<sup>nd</sup>.

**Seasonal Prediction:** As per IRI Multi Model Probability Forecast for January 2013 to March 2013, issued in December 2012, there is a 60%-70% probability for temperature to be above normal in the country while the rainfall is to be climatological.

#### Inside this Issue

# Monitoring

- a. Daily Satellite Derived Rain fall Estimates
- b. Weekly Average SST Anomalies

#### 2. Predictions

- a. NCEP GFS Ensemble 1-7 day predictions
- b. Weekly precipitation forecast (IRI)
- c. 1 month experimental predictions by Paul Roundy and L. Zubair
- d. Seasonal Predictions from IRI
